Research needs a system that holds the whole problem.

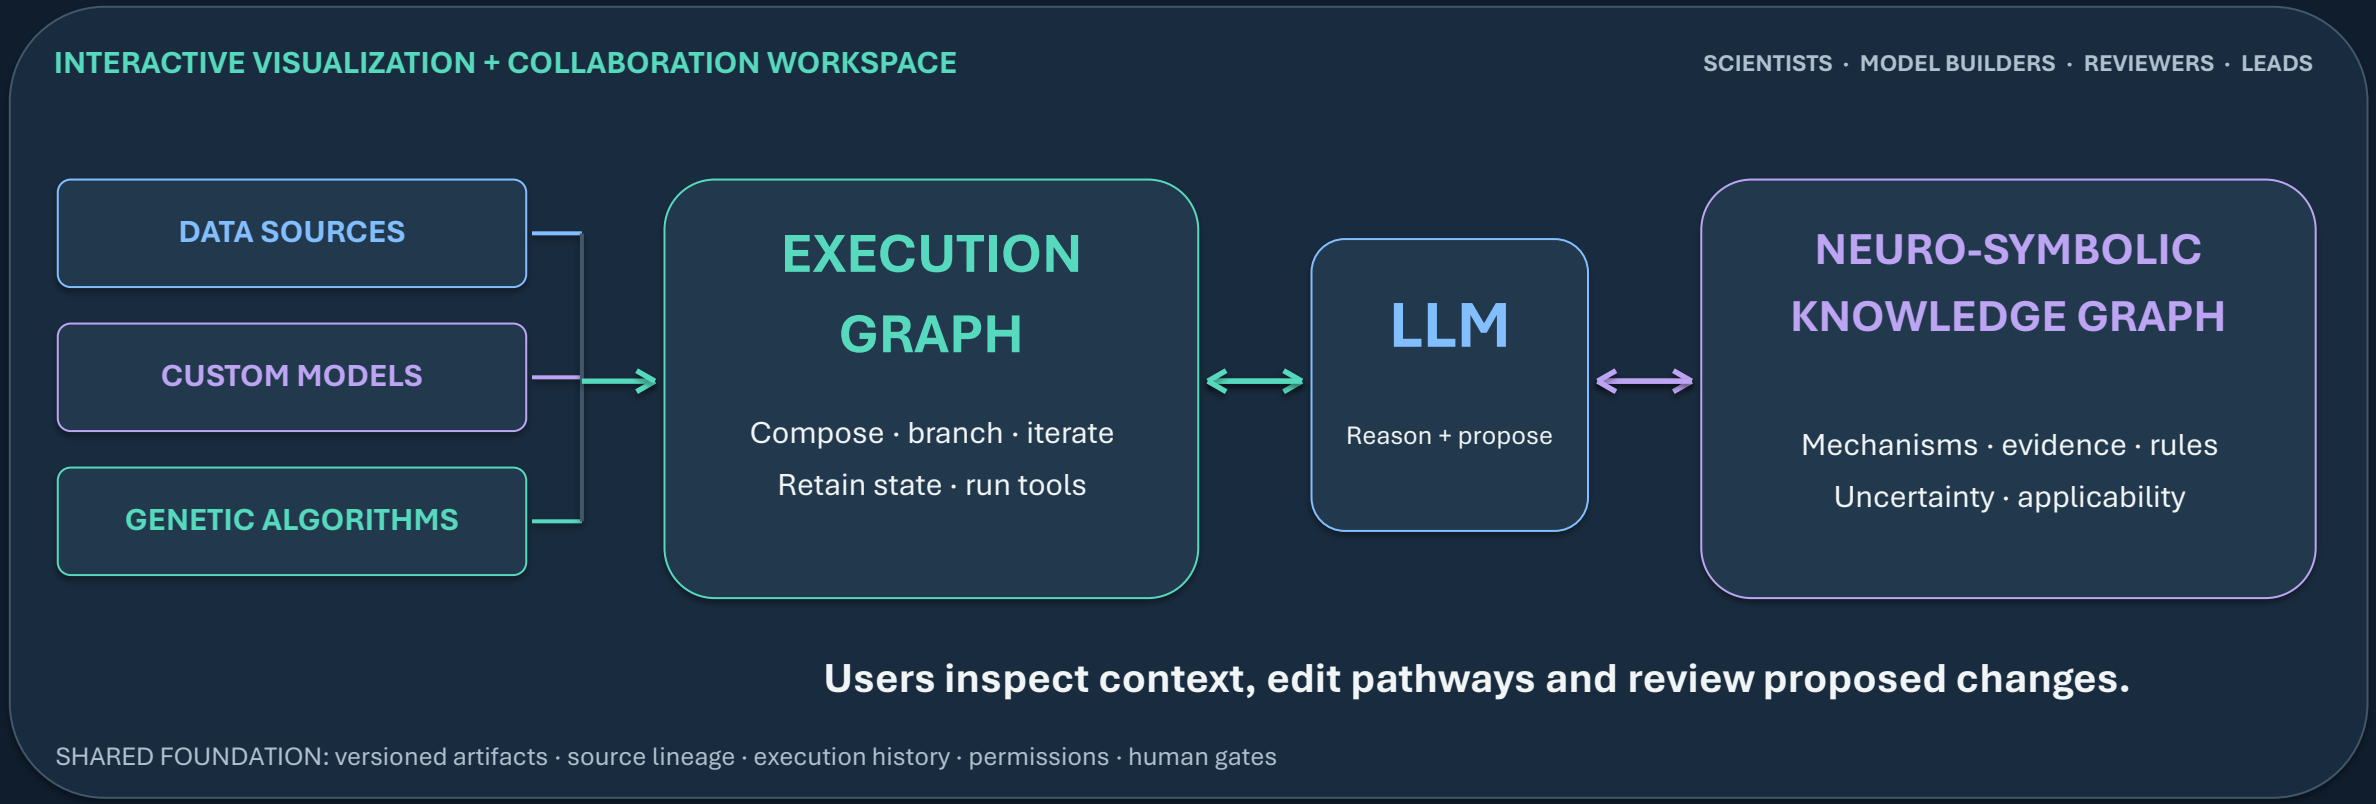

Connect large scientific context to a research plan that people can understand, change and execute.

WHY BUILD: make complex research manageable—and turn its context into executable decisions.

Compose the science. Reason over context. Execute the graph.

Genetic search, data and custom models become configurable scientific capabilities.

The differentiator is how the system learns—and stays usable.

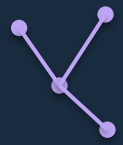

Four capabilities designed to reinforce one another across materials, chemistry and biology.

01 EVOLVE THE RESEARCH PATH

Search candidate designs and, over time, the sequence of work used to discover them.

02 REASON ACROSS MASSIVE CONTEXT

Navigate connected knowledge and evidence; bring the relevant context to each decision.

03 CUSTOMIZE WITHOUT A FIXED PIPELINE

Mix data, genetic search and custom models by editing the executable campaign graph.

04 LET EVERY ROLE SHAPE THE WORK

Scientists, developers and reviewers inspect, customize and intervene through visual views.

THE VALUE TO PROVE: faster adaptation, better decisions and reusable scientific learning.
