Research changes. Its software should change with it.

Amphora is building an engine for research pathways that adapt as evidence arrives.

Make the next step clear, executable and explainable.

Our thesis: less rebuilding between tools, stronger decision context, and more reusable work across programs.

The economic target: reduce the work between a promising result and a defensible next decision.

Make the research pathway an asset we can improve

One connected system for scientific knowledge, executable work and outcome-linked learning.

01 KNOWLEDGE

What can we rely on?

Mechanisms, evidence, uncertainty and limits.

→

02 CAMPAIGN

What should run next?

Editable steps, branches, experiments and human gates.

→

03 HISTORY

What did we learn?

Every attempt, decision and outcome retained.

FUTURE SEARCH: compare and evolve whole research pathways under scientific and human review.

Our proposed distinction is this governed combination across materials, chemistry and biology.

Strong alternatives raise the bar for Amphora

These products already solve meaningful parts of scientific work. We must win on the combined use case.

EXISTING ALTERNATIVE	WHAT IT ALREADY BRINGS
Benchling / Claude Science	Scientific AI, context and tool orchestration
Citrine / Schrödinger	Materials or molecular optimization
Synthace / Automata	Experiment design, automation and task graphs
Recursion OS	Integrated computational + physical discovery

AMPHORA TARGET

Versioned, evolvable research maps linked to scientific evidence.

Cross-domain.
Scientist-controlled.

The test: better campaign change, scientific traceability and reuse—not a longer feature list.

S1 Benchling AI · S2 Citrine Catalyst · S4 Schrödinger active learning · S5 Synthace · S6 Automata LINQ · S7 Recursion OS · S8 Claude Science

A change of scientific direction should preserve the work

Our design makes the pathway, its scientific limits and its history part of the same product.

01	**Change the path**	Insert a new assay or evaluator without rebuilding the whole campaign.
02	**Protect the meaning**	Carry source, species, method and model limits into every decision.
03	**Reuse what worked**	Transfer reviewed steps and patterns while keeping product-specific evidence.

WHY NOW

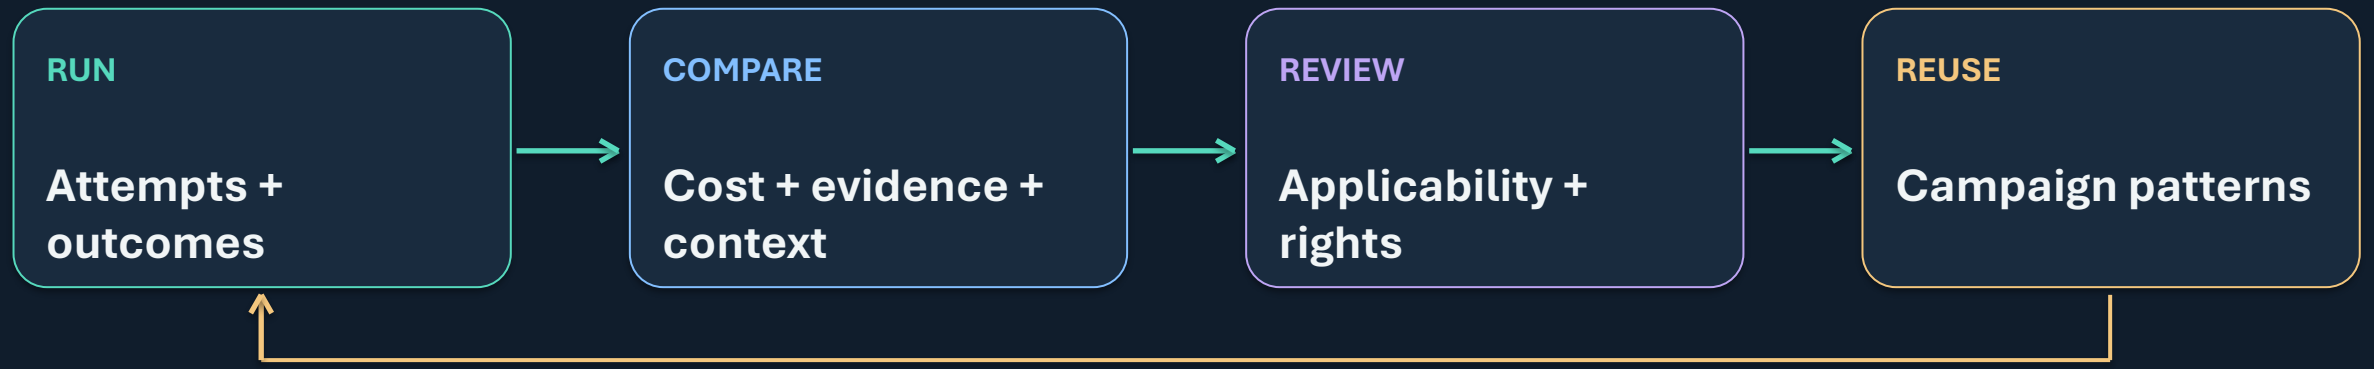

Scientific AI and lab automation are expanding. Adaptable research execution can turn those tools into repeatable value.

Build the shared execution and evidence layer; connect specialist models, data platforms and labs.

S1 Benchling AI S2 Citrine Catalyst S6 Automata LINQ S8 Claude Science

Each campaign can leave behind more than a result

The accumulating asset is a reviewed history of which research paths worked, where and why.

START WITH A FOCUSED PRODUCT PROGRAM

Prove value on delivery/formulation campaigns.

EXPAND THROUGH REPEATABLE CAPABILITIES

Reuse across materials and biology.

Defensibility must be earned through validated outcomes, integration and authorized reuse.

Convert reusable code into a validated research engine

A staged proof program connects the architecture to customer value.

FOUNDATION IN THE CHECKOUT

Evolutionary search
Mixture optimization
Feature selection
Evidence machinery

Source-reviewed; integration remains.

A	**Working engine**	Two product representations; one search core and traceable graph.
B	**Scientific credibility**	Reviewed data and validated evaluators; explicit limits on transfer.
C	**Commercial evidence**	Pilot against the current workflow; measure change effort, reuse and cost.

Investment case: prove repeatable research value first; earn the right to expand the platform.

Competitive sources and claim boundaries

Official product descriptions reviewed 16 September 2026. Links open the underlying source.

S1 Benchling AI

Scientific data, AI and model access

S2 Citrine Catalyst

Goal-to-workflow AI in materials

S3 Citrine sequential learning

Iterative experimental optimization

S4 Schrödinger active learning

Physics-based active learning

S5 Synthace

Experiment design and automation

S6 Automata LINQ

Task graphs and conditional execution

S7 Recursion OS

Integrated drug-discovery platform

S8 Claude Science

Scientific agents and reproducible work

Vendor claims are not independent tests. Amphora differentiation is a thesis to validate;
this deck makes no exclusive-novelty, patentability, clinical-success or measured-ROI claim.
